

Things to consider when fitting drop down rails

- > Technicians will not fit a drop-down rail unless it is to a solid or block wall.
- > If fixing to timber stud and non-structural walls, noggins or other suitable means of support must be used to support the rail.
- > If fitting to steel studs, the frame needs to be strengthened with blocking or similar so that the structure is strong enough to hold the rail.
- > Rails should always be installed by a qualified tradesperson.
- > Over time the mounting screws can be affected by exposure to water which may cause the screws to loosen or rust. You should regularly check that the rail is fastened securely to the wall and retighten or replace mounting screws when required.
